ABSTRACT

In one embodiment, a method includes a step of: (a) with at least one device supported by a user while the user is in locomotion on foot on a surface, determining an amount of force exerted by at least one foot of the user on the surface during at least one footstep taken by the user. In another embodiment, a method includes steps of: (a) with at least one sensor supported by a user, monitoring movement of the user while the user is in locomotion on foot; and (b) determining a cadence of the user based upon an output of the at least one sensor. In another embodiment, a method includes steps of: (a) with at least one sensor supported by a user while the user is in locomotion on foot, monitoring movement of the user while the user is in locomotion on foot; and (b) determining a stride length of the user during at least one footstep taken by the user based upon an output of the at least one sensor.
